Ashwin Chembu

(341) 356-1722 | ashchembu@gmail.com | San Francisco, California

PROFILE

Business technology consultant turning CRM behavior, metadata, and stakeholder feedback into validated requirements, UAT evidence, and implementation-ready handoffs. Adds software and healthcare-data depth to workflow delivery.

TECHNICAL SKILLS

CRM / Analysis: Salesforce/Veeva workflows, metadata inspection, UAT, source-to-target mappings
Engineering: SQL, Python, React, Node.js, REST APIs, Snowflake, data-quality checks
Delivery: Acceptance criteria, enhancement backlogs, decision logs, user guides, executive presentations

EXPERIENCE

Business Technology Solutions Associate | ZS Associates — **South San Francisco, CA | Jun 2024-Present**

- Implemented **React**/JavaScript account-plan submission and manager approval with **CRM**-backed data services, timestamps, review history, and confirmation paths, simplifying field-user actions while preserving review traceability.
- Audited a **164-row** Salesforce/Veeva field inventory across objects, picklists, dependencies, profiles, and permissions; retained **107** unresolved mappings as explicit blockers while separating verified reuse from pending decisions.
- Built and reconciled a **104-case CRM UAT** system across **11** workflow areas and **17** sheets, preserving reviewer decisions, sequential IDs, dropdown validation, formulas, and execution evidence for traceable acceptance review.
- Converted **CRM** metadata, live workflow observations, meeting transcripts, and stakeholder comments into user guides, decision logs, executive decks, and prioritized backlogs that connected implementation status to explicit handoffs.
- Translated ambiguous healthcare stakeholder needs into testable rules, API integrations, and source-to-target mappings, documenting acceptance criteria and unresolved decisions so delivery teams could implement scoped changes.

Founder and Lead Developer | Tallyrus — **Jun 2023-Sep 2025**

- Led product planning, educator testing, and iterative development for the collaborative essay-feedback platform, translating user feedback into rubric and review workflows and raising **five figures** to fund product development.
- Designed **React** rubric and essay-review interfaces that connect teacher materials to generated feedback, incorporating educator testing and iteration so users could inspect writing quality while retaining consistent scoring logic.
- Integrated **React**/TypeScript and Express product workflows with Google OAuth, protected routes, MongoDB persistence, and secure sessions, connecting authenticated educator access to document and essay-feedback operations.
- Connected Express/Multer upload routes for teacher files, rubrics, and historical essays to AWS S3 storage and MongoDB assignment records, making educator materials available to downstream grading and review workflows.
- Implemented a Flask grading API that validates rubric, essay, prompt, and historical-example inputs before generating JSON feedback, connecting model requests to the review workflow without treating automated output as a final grade.

Data Analyst / Web Development Lead | Tech4Good at UCSC — **Mar 2023-Jun 2025**

- Implemented anonymous and multi-select polling with TypeScript/Figma APIs, including changed votes, per-option response displays, grouped widgets, and reusable Likert selections so teams could collect and revisit collaborative feedback.
- Implemented **20+** attributed Node/Express REST routes with MongoDB persistence and logging for chat, text-entry, and polling workflows, supporting threaded messages, anonymous responses, editing, voting, and admin controls.
- Analyzed **43,340** anonymized interaction rows across **2,805** sessions with Python/Pandas, calculating group active-time measures and building Excel/XLSX exports to turn collaboration records into structured research evidence.
- Built Power BI and Tableau research dashboards alongside Python, R, and **SQL** analysis, translating findings into visual summaries for multidisciplinary stakeholders while keeping research interpretation connected to supporting data.

PROJECTS

Healthcare Dashboard | Workflow UI Prototype — **Public UI prototype**

- Designed healthcare account and trial-management dashboard prototypes in **React**/TypeScript and Vue, translating account hierarchies, ongoing trials, and site progression into scannable interfaces for stakeholder design review.
- Built reusable metric cards, progress steppers, follow-up queues, and barrier summaries, organizing complex healthcare workflow status into consistent component patterns that made pending actions easier to inspect in product demos.
- Added task-editing and trial-detail modals alongside account hierarchy views, connecting high-level progress summaries to detailed workflow interactions so stakeholders could review the prototype and validate interface behavior.

Private Filedrop | Secure File Exchange — **Jun 2026-Aug 2026**

- Built password-protected browser uploads and API-key-protected Express APIs with **OpenAPI** documentation, organizing files by metadata, tags, project paths, and version history so devices and AI clients could exchange artifacts securely.
- Added local and S3-compatible storage drivers with migration tooling that preserves file bytes and metadata, retaining rollback sources and unguessable download links to support durable, versioned handoffs across computers.
- Deployed the Express service on Render with persistent storage and health checks, documenting browser, REST, **OpenAPI,** and MCP setup so users could connect clients, verify transfers, and coordinate file handoffs between sessions.

Job Hub | Application Workflow Platform — **Jul 2026-Aug 2026**

- Built an **eight-workspace React**/TypeScript platform with a Cloudflare Worker API and **four D1 tables**, using revision-based writes, stale-state recovery, and local fallback to keep application and preparation records consistent across devices.
- Bound application transitions to exact package IDs and immutable artifact/upload hashes, using idempotent actions and state-preserving retries while routing genuine judgment or access blockers to a human-review exception queue.
- Built Node.js/Python resume workflows that map role requirements to verified evidence, reject stale source fingerprints, and combine ATS extraction, rendered-page review, duplicate prevention, and exact-file checks for reproducible packages.

EDUCATION

University of California, Davis | B.S. Computer Science | GPA: 3.7 — **Davis, CA | Graduated Jun 2025**
